Wi-Fi connected, but websites do not open

SAH-NET-001 | Version 1.0 | Category: network | 14 October 2026

SYNTHETIC DEMO CONTENT - not approved company policy. Employee checks only. No autonomous system changes.

APPLIES TO

Sample Windows laptop scenario. The employee reports connected Wi-Fi but cannot browse. This article does not diagnose VPN-only or single-application failures.

CLARIFY FIRST

Ask whether one website or several websites fail, whether the problem just started, and whether the device shows a connected network. Record the visible error text without passwords or private URLs.

EMPLOYEE CHECKS

1. Ask the employee to open two familiar, permitted websites.
2. If only one fails, record that site-specific symptom and hand off; do not reset the network.
3. If both fail, ask whether Wi-Fi is enabled and the expected approved network is selected. If disconnected, the employee may reconnect using credentials they already possess, entered privately.
4. Retry the original task and ask whether it now works.

STOP AND HAND OFF

If access still fails, or the approved network is unknown, send the symptoms and checks to an engineer. Do not change DNS, disable security software, reset network settings or restart shared office equipment.

COMPLETION EVIDENCE

Ask: Can you now open the websites you needed? A connected icon alone is not success. Require an explicit employee statement that the original issue is resolved.
